Eosinophil Cationic Protein (ECP)
Test Code: 42

Clinical and Procedure

Clinical Utility
Serum ECP levels correlate with the severity of the patient's asthma. Increased ECP levels are predictive of exercise induced asthma and the propensity to develop a late asthmatic reaction (LAR). ECP levels increase after allergen exposure and these increases are reduced after immunotherapy. Serum ECP measurements may be used to monitor anti-asthma treatment and help optimize drug dosing.

Procedure
ImmunoCAP®-FEIA. This test has not been cleared or approved for diagnostic use by the U.S. Food and Drug Administration.

Turnaround Time
5-7 business days from receipt of specimen

Specimen Information

<tr>
<td>serum</td>
<td>42</td>
<td>83520</td>
<td>Yes</td>
<td>1 mL (min. 500 uL)</td>
<td>ECP results are reported in nanograms per mL (ng/mL). The reference interval is less than 32.5 ng/mL. This represents the lower 95th percentile of a healthy adult population.</td>
</tr>
</tbody>
</table>

Special Instructions
- Collect the blood in 4 mL vacutainer hemogard SST tube. The tube should be completely filled and then gently inverted 5 times.
- Allow the blood to clot at room temperature (20-24° C) for 60 minutes (+/- 5 min).
- Centrifuge the serum at 1000-1300 x g for 10 minutes at room temperature.
- Stability 48 hours ambient, 7 days at 2-8°, >2 weeks frozen at -20°
- Stable for 3 freeze/thaw cycles.

Disclaimer
Specimens are approved for testing in New York only when indicated in the Specimen Information field above.

The CPT codes provided are based on Viracor Eurofins’ interpretation of the American Medical Association’s Current Procedural Terminology (CPT) codes and are provided for general informational purposes only. CPT coding is the sole responsibility of the billing party. Questions regarding coding should be addressed to your local Medicare carrier. Viracor Eurofins assumes no responsibility for billing errors due to reliance on the CPT codes illustrated in this material.
